"Method of Preparing O-Acylated N-Substituted Hydroxylamines"

USSR Author's Certificate No 222398, filed 29 Dec 66, published 16 Jan 69  
(from RZh-Khimika, No 5 (II), 10 Mar 70, Abstract No 5 N863 P)

Translation: Biologically active compounds with the general formula

are prepared by the reaction of alkyl- or arylisocyanates with N-carbothioalkyl-N-alkyl- or N-carbothioalkyl-N-arylhdroxylamines in an organic solvent at 50-60°. Example. 0.0141 mole of freshly distilled MeNCO in absolute dichloroethane (II) is slowly added dropwise to 0.0122 mole 3-C<sub>6</sub>H<sub>4</sub>N(OH)COSPr-iso in 50 ml at -5°, the mixture is agitated for 3 hrs at about 20°, and for 5 hrs at 40-50°, the solvent is distilled off, yielding I (R = C<sub>6</sub>H<sub>4</sub>, R' = iso-Pr, and R'' = Me), yield 75%, melting point 61° (benzene-petroleum ether). I modifications are similarly obtained (R, R', R'', % yield, and melting point in °C are indicated):

"Synthesis of Some Dialkyl-N-(2-benzthiazolyl)-amidophosphates"

Tashkent, Uzbekskiy Khimicheskiy Zhurnal, No 4, 1973, pp 63-64

Abstract: To a solution of 1.5 g of aminobenzthiazole in 10 ml of dry acetone, 1.66 g of freshly distilled diisopropyl phosphite and 2 ml of  $\text{CCl}_4$  were added. After addition of 1.5 ml of triethylamine and stirring for 2 hrs at room temperature followed by 1 hr at  $50^\circ$  and after an overnight storage, the precipitated acid chloride was removed, the solvent evaporated and the residual oil washed with HCl to yield the dialkyl-N-(2-benzthiazolyl)-amidophosphates. The agents did not exhibit adequate defoliative activity.

"A Defoliant"

USSR Author's Certificate No 325967, filed 23 Sep 70, published 25 Feb 72  
(from RZh-Khimiya, No 22, Nov 72, Abstract No 22N479 P)

Translation: A defoliant is proposed which contains  $Mg(CO_3)_2$ . The herbicide is distinguished by the fact that the severity of its effect is reduced by using 2-butylthiobenzthiazole (butylcaptax). The  $Mg(CO_3)_2$  and butylcaptax are taken in a ratio of 1:1 or 2:1. The proposed mixture is tested for defoliating the thin-fiber grade of cotton plant. Application is done in the phase when 4-5 bolls have opened. On the 12-th day, leaf fall-off reached 82.5-93.7%; dry leaf content was 1.8%. T. A. Belyayeva.

"On the Optimum Content of Carbon and Chromium in Wear-Resistant White Irons"  
Moscow, Metallovedeniye, No 5, 1971, pp 45-46

Abstract: Effects of carbon (1.5-4.0%) and chromium (12.0-30.0%) on the wear resistance and strength of white irons are investigated and the results discussed. The wear resistance and strength of white irons are more affected by carbon than by chromium. White irons with a carbon content somewhat higher than the eutectic show the highest wear resistance, but their use is limited due to insufficient strength properties. These irons can be recommended for working under wear conditions without notable impact loadings. For parts of machines operating under conditions where a strength of ~90 kg/mm<sup>2</sup> is required, white irons with a carbon content of no more than 2.0% and 12-18% Cr should be used. "The Use of Dipyroxime(TMB-4) in Acute Intoxication With Methylmercaptophos"

Tashkent, Meditsinskiy Zhurnal Uzbekistana, No 7, Jul 71, p 73

Translation: Dipyroxime(TMB-4) is an active cholinesterase reactivator.

We administered TMB-4 to patients suffering from acute intoxication with methylmercaptophos, an organophosphorus insecticide used in cotton-growing to combat sucking insects. The effectiveness of TMB-4 is shown by the following example.

Patient N., 39 years old, a farm worker, was walking along a field which was being treated with methylmercaptophos sprayed from a tractor, and he was covered by one such spray wave of the pesticide. Eight hours later, he felt dryness of the mouth, thirst, acute weakness, vertigo, and headache. Later, vomiting and diarrhea developed.

He was taken to the hospital in 20 hours in serious condition: he was semiconscious, vomiting continuously, and defecating involuntarily. Subsequent pathology consisted of acute dehydration of the body and

1/2

- 46 -

USSR

ROZIN, D. G., Meditsinskiy Zhurnal Uzbekistana, No 7, Jul 71, p 73

deterioration of cardiovascular functions. Despite antidote therapy with atropine and infusion of liquids (plasma, physiological saline, and glucose solution), his life was threatened.

The patient was given 3 ml of TMB-4: 1 ml intravenously and two doses of 1 ml subcutaneously at 1 hour intervals. After that, his condition improved: he became conscious and vomiting and diarrhea subsided. During the rest of the day, he still felt very weak. However, 48 hours later, he was getting up from bed by himself and walking around.

The results achieved testify to the effectiveness of TMB-4 in acute poisoning with methylmercaptophos.

"Some Cases of Acute Anthio Poisoning"

Tashkent, Meditsinskiy Zhurnal Uzbekistana, No 5, 1971, p 59

**Abstract:** Nine persons became ill 6 hours after weeding cotton on a field 4 days after it had been sprayed with anthio, an organophosphorus insecticide with systemic and contact action. They complained of severe weakness, vertigo, headache, nausea, and abdominal pains. Upon admission to a hospital, their condition was marked by skin pallor, tachycardia, dullness of the heart sounds, and arterial pressure ranging from 115/70 to 130/50 Kg. Cholinesterase activity was inhibited by 30 to 70%. The blood changes included slight leukocytosis, eosinopenia, and monocytopenia. Coprological examination revealed intestinal dysfunction. All the patients responded to treatment (gastric lavage, atropine injections, symptomatic therapy) and were discharged in satisfactory condition after 9 to 12 days in the hospital.

LIL-3. DETERMINATION OF THE CONDITIONS OF INTENSE MIXING OF A MELT BY AN EXTERNAL MOBILE MAGNETIC FIELD FOR GROWTH OF SEMICONDUCTING SINGLE CRYSTALS

[Article by V. V. Antipov, K. M. Rozin, M. P. Shevchenko, Moscow: Naukamash, 1971. Simposion po poluprovodnikovym krasnolitvam. Plenich, Russia, 12-17 June, 1972, p. 27]

single crystals which in the molten state are characterized by the metallic type of electrical conductivity, an external mobile magnetic field of industrial frequency can be used which in the general case has translational and rotational components. The basis for this interaction is the more or less intense paramagnetic interaction of the magnetic field with the electrically conducting melt.

For purposes of intensification of the growth processes of semiconducting materials which in the molten state are characterized by the metallic type of electrical conductivity, an external mobile magnetic field of industrial frequency can be used which in the general case has translational and rotational components. The basis for this interaction is the more or less intense paramagnetic interaction of the magnetic field with the electrically conducting melt.

The maximum effect is achieved here in the case of the turbulent nature of mixing of the melt in the hydrodynamic boundary layer.

The theory of the hydrodynamic boundary layer permits establishment of

the region of existence of the turbulent conditions at the crystallization front for the laminar nature of the basic flow of the melt.

In view of the difficulty of the detailed calculation of the paramagnetic interaction of the magnetic field with the melt, the theory of approximate similarity was used which on the basis of studying the behavior of the melt material permits determination of the required parameters of the model insuring mixing of any other melt in the given regime.

On the basis of the theoretical relations obtained and the experimental research on models of materials, the optimal values of the intensity of the external mobile magnetic field were calculated for various semiconducting materials.

A comparison of the results obtained with the known published data indicates their satisfactory correspondence.

Rozin S/OS  
6-73

III-13. RATE CHARACTERISTICS AND THEIR APPLICATION IN CONTROLLING CRYSTAL GROWTH PROCESSES

[Article by K. H. Rozin, Moscow; Novosibirsk, III Symposium po Protsessam Rosta

i Silicium poluprovodnikovym Kristallev i Mende, Russia, 12-17 June, 1972, p. 41]

The development of new methods of growing single crystals, including more or less broad temperature range makes a highly urgent problem of the development of the program to control the growth process.

In order to describe the growth process, in particular, to program the growth process in the temperature range, the rate characteristics were used as applied to the phase transition of the liquid-crystal.

The expressions of the rate functions were obtained for different types of interaction of the crystal-melt.

Use of the rate functions permitted a program to be compiled to grow several semiconductor crystals for the given growth parameters, in particular, for the fixed crystallization rate.

Comparison of the results obtained with the experimental data demonstrated for a number of cases their quite close correspondence which makes it possible to use the rate functions for the description and programming of the indicated processes.

"Calculation of Effective Impurity Distribution Coefficients in Growing  
Single Crystals From the Melt"

Moscow, Izvestiya Akademii Nauk SSSR, Neorganicheskiye Materialy, Vol 7,  
No 7, Jul 71, pp 1105-1109

**Abstract:** From the investigation of KCl-monocrystals with Pb, Zn, and Cu impurities, grown from melt by the Kirovsk method, it was found that the distribution of impurities does not comply with the distribution character determined from a usually used function. This non-conformity is analyzed and it is demonstrated that in the real growing process the part of the liquid phase which practically reacts with the growing crystal has to be considered and that the mentioned non-conformity can be taken into account by experimentally determinable distribution coefficients. An equation characterizing the impurity distribution is presented. Four illustrations, three formulas, thirteen bibliographic references.

"The Effect of Benzimidazole Derivatives on the Heat Resistance of Tradescantia Leaf Cells", pp 50-54, Sentez Belka i Rezistentnost' Kletok, (Protein Synthesis and Cell Resistance), Leningrad, "Nauka," 1971, 104 pp

**Abstract:** The resistance of Tradescantia leaf cells to the effect of 41°C temperature and the infiltration of solutions of test substances into leaf fragments were determined according to the Aleksandrov method (1955). Under the influence of benzimidazole, 2-methylbenzimidazole, and 2-benzyl-benzimidazole (dibazole) in a concentration range of  $4.1 \cdot 10^{-7}$  --  $4.1 \cdot 10^{-9}$  M, the heat resistance of cells increased. 1,2,3,-Trinethyl-benzimidazole was ineffective. In the presence of chloramphenicol ( $3.1 \cdot 10^{-7}$  --  $3.1 \cdot 10^{-9}$  M) or puromycin ( $2.1 \cdot 10^{-8}$  --  $2.1 \cdot 10^{-10}$  M), stimulating effect of benzimidazole derivatives on the heat resistance of Tradescantia cells was not observed.

**Abstract:** The intensive incorporation of  $C^{14}$ -leucine in parasympathetic nerve cells of isolated frog auricles is shown by the autoradiographic method. Puromycin ( $5 \cdot 10^{-5}$  g/ml) completely suppressed the incorporation of amino acid. Within one hour after 5-minute damage of the auricles with distilled water, the incorporation of leucine did not take place in 28% of the cells, positively declined in 5%, and did not change in the remainder. Within two hours after damage, the quantity of cells not incorporating amino acid dropped to 21% and the percentage of cells with reduced incorporation reached 15%. The question of the role of protein synthesis in the restoration of nerve cells after their damage is discussed.

"The Possible Significance of Protein Synthesis in the Repair Mechanism of Nerve Cells After Damage", pp 14-18, Sintez Belka i Rezistentnost' Kletok, (Protein Synthesis and Cell Resistance), Leningrad, "Nauka," 1971, 104 pp

**Abstract:** By means of vital staining with methylene blue (0.01 %), it was shown that the percentage of damaged parasympathetic nerve cells declined with the passage of time after a 5-minute injury of isolated frogs auricles with distilled water. This process was suppressed by inhibitors of protein synthesis puromycin ( $5 \cdot 10^{-5}$  g/ml) and chloramphenicol ( $2 \cdot 10^{-5}$  g/ml) and was intensified by dibazol ( $1 \cdot 10^{-7}$  g/ml). The role of protein synthesis is observed in the repair mechanism of nerve cells after damage.

"Study of the Role of Protein Synthesis in the Mechanism of Action of Pharmacological Substances on Cell Resistance, pp 3-7 Sintez Belka i Rezistentnosti' Kletok, (Protein Synthesis and Cell resistance), Leningrad, "Nauka," 1971, 104 pp

**Abstract:** It has been established that under the influence of benzimidazole derivatives the resistance of animal cells to damage increases. A number of facts, partially cited in the present collection, provide a basis for demonstrating that intensification of protein synthesis is of substantial importance in the mechanism of increasing cellular resistance under the influence of these compounds. Judging by the materials of the collection, other biologically active substances increasing the nonspecific resistance of the organism are also capable of intensifying protein synthesis in animals cells.

243096 IMAGE CONVERTER TUBE has between a collector and a screen a concentric arrangement of channel multipliers coaxially with the cylindrical surface of the shell. Their ends are cut to a chamfer of 45° with the centre line of the tube where they face the screen disc which has an anisotropic conductivity. The beneficial effect is that the electrons from the electron gun are prevented from describing a straight-through transit across the multiplier.

"Hetarylimidazoles. I. The Synthesis of 2-Hetaryl-4,5-Diarylimidazoles"

Riga, Khimiya Geterotsiklichesikh Soyedineniy, No 5, 1972, pp 631-632

**Abstract:** It is recognized that the biimidazoles possess photochromic and thermochromic properties. However, as yet no data are available on the photo- and thermochromic properties of heterosubstituted biimidazoles. In order to make such studies possible, fifteen 2-hetaryl-4,5-diarylimidazoles -- which have not been previously described -- were synthesized by condensation of benzyl or p-tolyl solutions with heterocyclic aldehydes in acetic acid in the presence of ammonium acetate. The reactions were carried out as follows: to 20 ml of boiling glacial acetic acid containing 5 g of ammonium acetate was added 30 ml of a warm solution of acetic acid containing 0.01 mole of benzyl (or p-tolyl) and 0.01 mole of the appropriate aldehyde in a dropwise manner over a period of 2 hr. The reaction mixture was boiled for an additional 3 hr., following which it was cooled and poured on 250 g of ice with an excess of NH<sub>4</sub>OH. The resultant precipitate was removed by filtration, washed with water, dried, and recrystallized. These preparations were then subjected to IR spectroscopic analyses.

Eksperimental'nyye virusnyye infektsii (sравнительная патоморфология) (Experimental Viral Infections (Comparative Pathomorphology)). Moscow, Meditsina, 1972, 263 pp, 3,000 copies printed

Annotation

The monograph is devoted to the comparative study of the pathomorphology of the central nervous system in experimental animals with viral infections.

In addition to morphological methods, histochemical, virological and serological methods were also used.

In addition to serious theoretical significance the work presents great interest for practical medicine in connection with the broad program for vaccinating the population against viral infections and in particular neuro-infections (poliomyelitis, tick-borne encephalitis).

The monograph is intended for pathologists, virologists, clinical neuro-pathologists, and specialists in infectious diseases

Introduction

At the present time viral diseases occupy one of the leading places in human pathology and the fight against them is a most important task of medicine.

In connection with the fact that the search for chemical therapeutic preparations and antibiotics for the treatment of the majority of viral

1/6

- 102 -

USSR

ROZINA, E. E., Meditsina, 1972, 263 pp

diseases -- for all the promise that such research offers -- still has not yielded any kind of positive results the methods of vaccination prophylaxis and various methods of serological therapy continue to be the most timely.

In the general complex of methods for studying viruses, morphological methods continue to occupy the basic place both in the study of the pathogenesis and pathomorphology of disease as well as in the selection of strains for vaccine production and in the study of the nature of the vaccination process.

In the development of viral vaccines one of the key questions is the selection of viral strains that must be high in immunogenicity and low in pathogenicity for humans. In this connection it becomes necessary to determine the signs of lowered virulence of a virus; this is at once a most complex problem in the production of vaccine strains. While avirulent mutants are produced through the artificial action of mutagens there are cases known when strains with low virulence are produced by natural means (Jenner vaccine).

The "virulence" of a virus is a collective concept that forms from the many genetic features of a virus that characterize its ability to multiply in the tissues of the host organism and to overcome morphological, physiological and immunological barriers in the organism as the infection process develops. At the same time it must be noted that the virulence of a virus refers not

2/6

USSR

ROZINA, E.E. Meditsina, 1972, 263 pp

only to its genetic properties but also to the very nature of the interaction between the virus and the host organism and to the dynamics of development of the entire chain of cause-and-effect relations between the micro- and macro-organism throughout the entire infection process. In infectious pathology, which assesses the pathogenetic mechanisms of development of disease, this principle is especially important.

From our point of view great interest was afforded by comparative experimental morphological studies of changes in the central nervous system due to both various strains of one and the same virus as well as different viruses in the experimental animals. At the same time the studies were conducted on models of viruses that possess neurotropic properties under natural conditions (poliomyelitis, tick-borne encephalitis) and on viruses that affect elements of the central nervous system under certain conditions (lymphocytic chorio-meningitis, smallpox vaccine).

There are few such comparative morphological studies in the foreign literature and none whatsoever in the Soviet literature. However these studies could show the particular features in the development of the pathological process characteristic of certain neurotropic viruses and could also reveal the reaction of elements of the central nervous system to the action of viruses.

3/6

- 103 -

USSR

ROZINA, E. E., Meditsina, 1972, 263 pp

A key task of the author was to determine the parameters of typical changes for one or another virus in the differential diagnosis of the pathological process caused by it. The author's experiment on monkeys made it possible to discover morphological tests of lowering neurovirulence of individual strains of different viruses and this may be of practical significance in the selection of vaccine strains in the production of antiviral preparations.

In analyzing his own experimental material on the pathology of various viral infections, the author had the opportunity to determine certain patterns in the pathogenesis of these diseases. These patterns relate to the role and significance of "barrier" mechanisms in the dynamics of development of neuro-infections, in the pathomorphology of atypical and effected forms of a disease and in the determination of immunomorphological reactions of elements of the central nervous system to viral infection.

"Some Cases of Acute Anthio Poisoning"

Tashkent, Meditsinskiy Zhurnal Uzbekistana, No 5, 1971, p 69

**Abstract:** Nine persons became ill 6 hours after weeding cotton on a field 4 days after it had been sprayed with anthio, an organophosphorus insecticide with systemic and contact action. They complained of severe weakness, vertigo, headache, nausea, and abdominal pains. Upon admission to a hospital, their condition was marked by skin pallor, tachycardia, dullness of the heart sounds, and arterial pressure ranging from 115/70 to 130/50 Hg. Cholinesterase activity was inhibited by 30 to 70%. The blood changes included slight leukocytosis, eosinopenia, and monocytopenia. Coprological examination revealed intestinal dysfunction. All the patients responded to treatment (gastric lavage, atropine injections, symptomatic therapy) and were discharged in satisfactory condition after 9 to 12 days in the hospital.

"An Aggregate System of Programed Control"

Moscow, Avtomatizatsiya Operatsiy Proyektirovaniya Protsessov Mashinostroyeniya  
(Automation of Operations in the Design of the Processes of Machine Building),  
edited by V. I. Dikushin, "Nauka," 1970, pp 5-10

**Abstract:** The large number of types of machine tools and the diversity of the functions which they fulfill requires the creation of a large number of programed control systems, which in turn makes it difficult to design and mass produce such systems.

These circumstances make it advisable to create an aggregate system of programed control. The principle of construction of an aggregate system of numerical control consists of the creation of a limited number of standardized devices, or aggregates, such as arithmetic units, units for input from papertape, memory registers, decoders, etc. Specific systems suitable for specific types of machine tools are built up from these devices. The systems can be classified into four basic types, two of which belong to the class of positional and rectangular systems and two of which belong to the class of continuing and general-purpose systems.

1/3

USSR

ROZINOV, A. G., and LEVIN, B. K., Avtomatizatsiya Operatsiy Proyektirovaniya Protsessov Mashinostroyeniya (Automation of Operations in the Design of the Processes of Machine Building), edited by V. I. Dikushin, "Nauka," 1970, pp 5-10.

The majority of programed control systems created up to the present time have been made from ferrite-transistor or ferrite-diode elements. However, the use of such elements in modern machine tools with numerical programed control would significantly reduce the capabilities of the machine tools by reducing the frequency with which control pulses could be transmitted. For this reason it is recommended that the basic element of an aggregate control system by the ASVT [Modular System of Computer Equipment], made from high-speed pulse-potential and potential-logical elements.

An analysis of various methods of building circuits from ASVT elements showed that it would be better to use the principle upon which general-purpose computers are based than the principle of a digital model. In digital computers, all arithmetic and logical operations are carried out sequentially by a central arithmetic unit. In a digital model, on the other hand, these operations are carried out in parallel by individual counters, accumulators, and so on.

"Spectral Study of the Mutual Effect of Functional Groups in  
Molecules of Tertiary Aromatic Phosphines"

Kiev, Teoreticheskaya i Eksperimental'naya Khimiya, Vol 7, No 4,  
1971, pp 514-519

Abstract: At this time there is no single view of the reaction  
between structural groups within molecules of aromatic phosphines,  
and the various assumptions made about them lead to contradictions  
in the interpretation of the electron transitions.

The authors studied electron and Raman spectra for the group  
 $(p-X_6H_5)P$ , where  $X = H, CH_3, OC_2H_5, Cl, Si(CH_3)_2$ , and  
 $H(CH_3)_2$ , and also for molecules of  $(C_6H_5)_3P(O)$ ,  $(C_6H_5CH_2)_3P(O)$   
and finally,  $(m-NO_2C_6H_4)_3P(O)$ .

The reaction was assumed to take place both by the  $p\pi-p\pi$ -transi-  
tion and the  $p\pi-d\pi$ -transition mechanisms.

"Phosphorylation of Trisubstituted Olefins With Phosphorus Pentachloride"

Leningrad, Zhurnal Obshchey Khimii, Vol 40, No 4, Apr 70, p 935

Abstract: In a previous article the authors reported that  $\beta$ -disubstituted unsaturated compounds which are considered unphosphorylatable are phosphorylated with phosphorus pentachloride if there are nucleophilic substituents along with the multiple bond and are not phosphorylated if the substituents are electrophilic. In the present article the ideas about activation with nucleophilic substituents in the phosphorylation reaction are extended to trisubstituted olefins. Even such weak electron-donor substituents as the methyl group promote phosphorylation. Previously unknown complex compounds of the type  $\text{MeC}(\text{X})=\text{C}(\text{Y})\text{PCl}_3^+\cdot\text{PCl}_6^-$ , where  $\text{X}=\text{Me}$ ,  $\text{Ph}$ ,  $p\text{-MeOC}_6\text{H}_4$  given  $\text{Y}=\text{Me}$  and

1/2

pp 62-66

by phosphorylation of styrene by phosphorus pentachloride in a number of aprotic solvents. This reaction is facilitated in the nonionizing aprotic solvents. The phosphorylation product yield increases significantly when the reaction is performed in the presence of phosphorus trichloride. This is connected with suppression of the side reaction of the chlorination of styrene. Photocolorimetric analysis confirmed the formation of the  $\text{PCl}_5 \cdot \text{L}$  complexes with electron donor aromatic ligands. The color of the phosphorus pentachloride solution in the solvents --- benzene derivatives --- arises from analog complex formation.

EFFECT OF HYPOXIA ON THE DAILY RHYTHM OF MITOTIC ACTIVITY IN THE BONE  
MARROW HYPOTHYROIDIC SYSTEM  
By S. Rozinskiy, K. Kharshik, Ya. Rozinskiy and S. Smirnov  
Institute of Biophysics, Siberian Branch of the USSR Academy of Sciences, Novosibirsk, No. 5, 1971, submitted

Article by S. Rozinskiy, K. Kharshik, Ya. Rozinskiy and S. Smirnov  
Institute of Biophysics, Siberian Branch of the USSR Academy of Sciences, Novosibirsk, No. 5, 1971, submitted  
for publication 17 April 1971, pp 14-17]

**Abstract:** Experiments performed on guinea pigs under varying illumination conditions and on animals kept for 14 days at an elevation of 7,000 m revealed a distinct relationship between the mitotic activity of bone marrow cell erythropoiesis and the illumination pattern. They also demonstrated hypoxic stimulation of the erythropoietic system.

**Introduction.** Investigations (Baranski, et al., 1971; Blumenthal; Bullough; Salberg and Sarnow; Mauer, Tuomari) demonstrated that during the day there is a change in mitotic activity in different tissues and on animals kept for 14 days at an elevation of 7,000 m revealed a distinct relationship between the mitotic activity of bone marrow cell erythropoiesis and the illumination pattern. They also demonstrated hypoxic stimulation of the erythropoietic system.

Baranski and Sarnow; Mauer, Tuomari demonstrated that during the day there is a change in mitotic activity in different tissues and on animals kept for 14 days at an elevation of 7,000 m revealed a distinct relationship between the mitotic activity of bone marrow cell erythropoiesis and the illumination pattern. They also demonstrated hypoxic stimulation of the erythropoietic system.

"Pilot-Scale Testing of Electric Melting of Gold-Antimony Concentrates"

Moscow, Tsvetnyye Metally, No 2, Feb 74, pp 33-35

**Abstract:** The task of this work was a large-scale test of the primary element of a proposed technological system for precipitative electric melting of gold-antimony raw material with extraction of the antimony and concentration of the gold. The results of the tests show that gold-antimony concentrates can be treated by electric melting with good results. The material balance and metal balance are presented for precipitative melting of the gold-antimony concentrate.

"Resistance of Refractory Materials in Antimony-Salt Solutions"

Elektrokhim. Rafinirovaniye Tyazh. Legkoplavk. Met. iz Rasplavl. Soley.  
[Electrochemical Refining of Heavy Low-Melting Metals from Fused Salts --  
Collection of Works], Kiev, Nauk. Dumka Press, 1971, pp 169-172, (Translated  
from Referativnyy Zhurnal, Metallurgiya, No 5, 1972, Abstract No 5 G424 by  
the author's).

Translation: The corrosion resistance of structural materials in type SU-2  
Sb melt and an equimolar mixture of NaCl + KCl is studied. The following  
technical refractories were tested: pure oxides, ceramic construction  
materials, oxygen-free compounds, glasses, and heat-resistant concrete. The  
resistance of the materials was determined from the change in weight of a  
specimen following repeated immersion in the melt and long holding. Pure  
materials of the oxides  $\text{Al}_2\text{O}_3$ ,  $\text{MgO}$ , and  $\text{ZrO}_2$  are recommended. 2 Tables.

"More Precise Definition of Flame Propagation Conditions"

Moscow, Doklady Akademii Nauk SSSR, Vol 192, No 1, May-Jun 1970,  
pp 135-137

Abstract: The theory of flame propagation relates the values of normal flame velocity at the border of its propagation and the intensity of heat losses to unit volume of the cooling zone of the burning. The author discusses the above relationship from the point of view of new, more precise data on flame velocity in subcritical composition mixtures of various fuels and the intensity of heat emission by radiation. The author thanks YA. B. ZEL'DOVICH for his valuable comments.

"Effect Of Irradiation By 14 Mev Neutrons On Some Parameters Of P217V and IT906A Transistors"

V sb. Radiats. fiz. nemet kristallov. T.3 Ch.2 (Radiation Physics Of Nonmetallic Crystals. Vol 3, Part 2--Collection Of Works), Kiev, "Nauk.dumka," 1971, pp 214-219 (from RZh--Elektronika i yeye primeneniys, No 12, Dec 71, Abstract No 12B532)

Translation: The paper investigates the dependences of the static transmission coefficient of the current  $V_{st}$  at the boundary of the saturation region and of the reverse current of the collector  $I_{co}$  with a disconnected output of the emitter, on the integrated neutron flux  $\phi$ . It is found that with respect to  $V_{st}$ , a type IT906A transistor is approximately eight times more resistant to irradiation than a type P217V transistor. The reverse current is comprised of the bulk current  $I_b$  and of the surface leakage current  $I_l$ :  $I_{co} = I_b + U/R_l$ . With an increase of the flux  $\phi$ ,  $I_b$  increases and  $R_l$  (resistance for surface leakages) is decreased. After attainment of the flux  $\phi \approx 4 \cdot 10^{12} \text{ cm}^{-2}$ ,  $R_l$  almost does not change from one transistor to another, even if the initial values of their  $R_l$  differ strongly. 6 ill. 3 ref. "Power-Supply Units for Electrochemical and Anodic-Mechanical Machine Tools"

Moscow, Stanki i Instrument, No 1, 1970, pp 15-17

Abstract: The article deals with the design considerations leading to the development of power-supply units for electrochemical and anodic-mechanical machine tools. Such power-supply sources must provide currents from 100 - 25,000 amperes and voltages from 2 - 236 volts, must provide for the smooth regulation and stabilization of the rectified voltage or current with an error of not less than  $\pm 10\%$  with respect to the initial value of the voltage or current, must provide for an operating time of the protection system against short circuits not in excess of 0.03-0.05 seconds and a minimum pulsation of the rectified voltage; provisions must be made for remote control and for automatic change of the current or voltage in accordance with change of the technological require- 15

"Effect of the Electrical Current on the Plastic Flow of Metal"

Sverdlovsk, Fizika Metallov i Metallovedeniye, Vol 30, No 4, Oct 70, pp 824-  
829

**Abstract:** A study was made of the plastic flow of zinc single crystals and polycrystals of zinc, cadmium, lead, and indium under the effect of direct and pulsed electrical current. Plastic flow was not observed under the effect of direct current. In the case of the pulsed method (600-4800 amp, pulse duration  $\sim 10^{-4}$  sec) considerable peaks of the plastic flow were detected. In the elastic region the current pulses showed no influence. An anomalously large number of peaks was observed in the area of the yield point of the specimens. This phenomenon is explained by the disruption resulting from the current pulses of fluctuating dislocation configurations.

'Method of Potential Functions in the Theory of Machine Learning'

Metod. Potentsial'nykh Funktsiy v Teorii Obucheniya Mashin [English Version Above]  
Moscow, Nauka Press, 1970, 384 pages (Translated from Referativnyy Zhurnal Kibernetika, No. 4, April, 1971, Abstract No. 4 V702K).

Translation: This monograph sums up the work of authors on development of the method of potential functions and its use in problems of pattern recognition, identification and automatic classification. Particular attention is given to mathematical problems related to the convergence of random processes, arising when the method is used, and its relationship to other methods of learning theory (in particular, methods of stochastic approximation). The reader must know mathematics as taught in a technical university; all other necessary information is provided by the authors. The book is designed for engineers and mathematicians working in the area of cybernetics, and also for students and graduate students specializing in this area.

The chapters are: Chapter I. Problem of Teaching Machines to Recognize Patterns (Statement of the Problem); Chapter II. Method of Potential Functions; Chapter III. Selection of a System of Functions  $\psi_i(x)$  and Potential Function  $K(x, y)$ ; IV. Convergence of Primary Procedure of Potential Functions Method;

"Nature and Mode of Action of Diazepam on Some Parameters of the Blood Circulation"

Moscow, Terapevticheskiy Arkhiv, No 8, 1973, pp 35-39

Abstract: Peroral administration of diazepam had no significant effect on the pulse rate, blood pressure, or EKG of cardiac patients with or without postinfarction neurotic manifestations. However, parenteral injection of the drug produced moderate hypotension, weak or moderate bradycardia and, in some cases, tachycardia. Experiments on cats showed that the hypotensive effect of diazepam is caused by a decrease in vascular tone resulting mainly from inhibition of the central regulation of sympathetic tone. The drug also relaxed briefly the smooth musculature of the vascular walls.

"Specific Effect of a Hydrogen Atmosphere on Oxygen Release by Tradescantia Chloroplasts"

Moscow, Doklady Akademii nauk SSSR, No 4, 1973, pp 980-982

Abstract: *Tradescantia fluminensis* chloroplasts were exposed to light after dark incubation under anaerobic conditions in an atmosphere of different gases. Incubation of the chloroplasts in helium and nitrogen had no effect on the release of oxygen; in both cases in intensity of the process was comparable to the aerobic control. Incubation of the chloroplasts in a nitrogen atmosphere, on the other hand, suppressed oxygen release. The inhibitory effect progressed quickly and after one hour of incubation, the rate of oxygen release decreased by 50% on the average. Unlike whole leaves, the effect of H<sub>2</sub> on isolated plastids was not reversible.

"Deformation and Stresses in Mounts of Roll Stands of Four-High  
Rolling Mills"

Moscow, Vestnik Mashinostroyeniya, No 9, Sep 73, pp 16-21

**Abstract:** The strength conditions in the mount of a roll stand of the four-high rolling mill 5000 of the All-Union Scientific Research, Planning, and Design Institute of Metallurgical Machinery were calculated. The deformations and stresses were determined, using Castigliano's theorem, for a simplified form of the mount according to a presented schema. The applied calculation method of the inflexibility and strength of closed type mounts considers the clearance between the mount stands and the bearings of supporting rolls and the variable stiffness of cross ties. On a level with the calculations, including the fatigue strength, the stressed condition of the mount was also investigated by the polarization-optical method on a simplified model

of optically active ED6-M material. The results are discussed by reference to optical stress-strain pictures (photoelastic method) and the stress-strain diagram of contour stresses. Determined values of the reserve strength factor and of the deformation and rigidity of the mount are interpreted. Four figures, two tables, twelve formulas, two bibliographic references.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. A NEW ELECTRON MICROSCOPE WITH HIGH RESOLN. IS DESCRIBED. ALL ITS LENSES ARE MADE FROM DIFFERENT TYPES OF PERMALLOY. THE COLUMN OF THE MICROSCOPE HAS HIGH MECH. STABILITY. THE THEORETICAL RESOLN. OF 2 ANGSTROM WAS REALIZED IN PRACTICE. THE ELECTRON OPTICAL MAGNIFICATION IN PHOTOGRAPHING IR PARTICLES ON A C SUBLAYER WAS 440,000 TIMES. PHOTOGRAPHS OF THE Au LATTICE, (200) PLANE, AND FRESNEL DIFFRACTION BANDS ON THE EDGE OF MOO<sub>3</sub> SUB3 CRYSTALS ARE GIVEN.

"The Effect of the Autonomic Nervous System on the Permeability of the Blood-  
Brain Barrier for Ca<sup>45"</sup>

Moscow, Doklady Akademii Nauk SSSR, Vol 192, No 3, 1970, pp 687-690

Abstract: White rats were used to study changes in the blood-brain barrier with respect to Ca<sup>45</sup> penetration when the condition on the autonomic nervous system was changed by administration of adrenalin. The parasympathetic nervous system was stimulated by intravenous injection of carbocholine. Ca<sup>45</sup> in the form of Ca<sup>45</sup>Cl served as an indicator of the permeability of the blood-brain barrier. This permeability was observed in various parts of the brain (cortex, caudal nucleus, thalamus, hypothalamus, pituitary, medulla oblongata, and cerebellum) of treated and untreated animals. It was found that adrenalin stimulation of the sympathetic nervous system leads to enhanced Ca<sup>45</sup> penetration of the blood-brain barrier in most parts of the brain. When the parasympathetic nervous system is stimulated by carbocholine, the Ca<sup>45</sup> penetration in the cortex, caudal nucleus, thalamus, hypothalamus, and cerebellum is reduced. The maximum reaction is achieved after 2 min and disappears after 5 or 15 min. Thus, when

the sympathetic nervous system is stimulated, the sympathomimetic substances in the blood (in these experiments the Ca ions) cross the blood-brain barrier and exert a direct effect on the autonomic centers, exciting the parasympathetic nervous system. When the parasympathetic system is excited, the transition of sympathomimetic substances is reduced, so that excitation of sympathetic centers is enhanced.

published 23 Dec 71, p 148

Translation: This Author's Certificate introduces a deflecting device for coding graphic information which contains a scanning mirror with electromagnetic drive, and an interferometer device for measuring displacements of the scanning beam. As a distinguishing feature of the patent, construction is simplified, the overall dimensions of the device are reduced, and accuracy is improved by fastening the scanning mirror on a point support and making the optical reflectors of the interferometers in the form of triple prisms located on the mounting of the scanning mirror, while the current coils of the drive are made in the form of two mutually perpendicular semicircles fastened to the mirror mounting and

Soviet Inventions Illustrated, Section I Chemical, Derwent, 1970

242372 **TYRE MANUFACTURE** This invention relates to equipment for rolling the folded layers of a tyre carcasse, and consists of a centre shaft (1) with longitudinal grooves in which the diaphragm (2) is mounted in conjunction with the ring-and-bearing assemblies (3). Each of these rings is fitted with a spring-loaded support (4). The centre ring (5) is fastened rigidly on the centre shaft so that the centre section of the article being made can be rolled under pressure. The friction roller (6) is the power drive. This design is an improvement on previous rolling equipment, in that the friction between the rolling rings and the surface of the article being rolled is almost eliminated, and permits articles having different profiles to be treated.

"Concerning the Effect of Hydrodynamics on the Distribution of Charge Carrier Concentration in a Homopolar Generator"

V sb. Vopr. fiz. nizkotemperaturn. plazmy (Problems in the Physics of Low-Temperature Plasma—collection of works), Minsk, "Nauka i tekhn.", 1970, pp 327-330 (from RZh-Mekhanika, No 4, Apr 71, Abstract No 4B96)

Translation: The paper deals with the problem of the effect of hydrodynamic flow on ionization-diffusion equilibrium of the discharge in the transverse magnetic field of a homopolar generator. The case where the velocity of hydrodynamic flow is comparable in magnitude with the rate of diffusion of the charged particles is considered. Hydrodynamic equations of motion of an incompressible gas are solved simultaneously with the equations of diffusion-ionization equilibrium. The results of computer calculations are given for a discharge in argon when the temperatures of the ions and neutral particles are equal to 500°K, the pressure is 0.1 mm Hg, the magnetic field is 1000 G, and the current is 10 A. "Asymptotic Calculations of a Double Integral for the Case of a Stationary Line"

Moscow. Zhurnal Vychislitel'noy Matematiki i Matematicheskoy Fiziki, Vol 10, No 4,  
Jul/Aug 70, pp 811-817

Abstract: Integrals of the type  $\int_S f e^{ik\phi} ds$  occurring in problems concerning wave diffraction and antenna theory are discussed; it is noted that the approximate calculation of such integrals for large values of the parameter  $k$  is ordinarily based on the stationary phase method and leads to expansions in which stationary terms and contour integrals figure. The case in which the phase function  $\phi$  is extremal not at one point but on a certain curve which is called the stationary line is considered. Integrals of this type are obtained in calculating the spread between rectangular antennas with parallel sides or coaxial parabolic antennas generally speaking, in cases in which the function  $\phi$  has the sense of the distance between points on parallel curves. The initial integral is reduced to the sum of integrals of slowly varying functions in terms of a stationary line and the sum of integrals over the curve  $L$  enclosing  $S$ .

"Effect Of AGC On The Level Of Transient Interference In Multichannel Systems Of  
Shortwave Communication"

Radiotekhnika, No 4, Apr 1972, pp 1-7

Abstract: The effects are considered of a change of the amplitude of signals in a shortwave channel on the level of transient noise in communication systems with orthogonal signals. A method is presented for finding the averaged value of the rate of change of the signal envelope from the integral distribution of the envelope, making it possible to manage without involved mathematical apparatus. The decrease of the reliability of reception because of transient interference during fading is evaluated and the requirements are determined for an automatic gain control system in the receiving channel [trakt] of the multiplexing device in order to reduce the probability of error. An analysis is made of the impairment of orthogonality under conditions of slow fading when the signal envelope throughout the sample changes insignificantly and abrupt phase fluctuations leading to a frequency drift of the signal being received are absent. Knowing the magnitude of the signal and the transient interference, it is possible to find 1/2

the dependence of the signal/noise ratio on the principle and rate of change of the signal amplitude. It is demonstrated that transient interference reduces the reliability of reception which cannot be increased by an increase of the signal power. However, it can be decreased by separation of all the bands of a telephony channel into narrow bands and the use of AGC in each of them. 1 tab. 4 ill. 6 ref. "Energy Aspect of Matching the Characteristics of an Amplifier of Modulated Oscillations and Signal Parameters"

Tr. Mosk. elektrotekhn. in-ta svyazi (Works of the Moscow Electrical Engineering Institute of Communications), 1970, vyp., pp 104-108 (from RZh-Radiotekhnika, No 11, Nov 70, Abstract No 11A62)

Translation: The variety of relationships for instantaneous values of plate circuit efficiency  $\eta_k(x)$  in the stages of amplifiers of modulated oscillations as a function of the modulation parameter  $x$  does not in the general case permit a unique answer to the question of what the characteristics of the amplifier must be to reach maximum average efficiency. A general solution to the problem of maximum  $\bar{\eta}_x$  is found which shows that this average efficiency takes on the maximum value throughout the interval of values of  $x$  under the condition  $a\eta_k(x) - W(x) = 0$ , where  $a$  is the proportionality factor;  $W(x)$  is the distribution of probability density for signal amplitudes. Thus the maximum average efficiency of amplifiers of modulated oscillations may be attained only if the characteristic  $\eta_k(x)$  of the amplifier is matched to the statistics of the signal to be amplified. It is shown that an analogous result may be found from the Cauchy-Schwartz inequality. One illustration, bibliography of seven titles. L. S.
